### Item #105

## Weight Bracket Set

Rev 110110

Caution: Small Parts. Not recommended for children under 12 yrs of age. Use Care when handling – sharp edges. Use of this item in its intended purpose may violate the safety standards of the original item for which it is intended to be used with.

Two styles of weight brackets are included in this kit – the 10 hole, or narrow bracket, and the 14 hole, or wide bracket. The 10 hole bracket was standard on the 06 through the 66 Series tractors. The 14 hole bracket was standard on the 86 Series only, but was retrofitted to many older tractors. They are fairly easy to distinguish from each other – the 10 hole bracket is about the width of the hood (see photo below), while the 14 hole bracket sticks out on both sides several inches. Refer to photographs for specific applications. It is our hope to offer a matching weight kit that will fit these brackets in the future.

1. Form as shown below.
2. Note the 14 hole bracket has two small gussets that must be formed and put in place separately. Apply a small amount of cyanoacrylate adhesive (CA or super glue) to the bottoms of these gussets and glue in place.
3. Paint red. Painting can be done prior to forming and installation, however paint may flake off at bends, and need to be touched up after installation.
4. Test fit to tractor and glue in place.
